Low Fidelity Prototype:

In my shopping cart low fidelity prototype I continued to use a minimal theme, with a lot of white space. I made it so the clearest next step for the user is to checkout, while still giving the user the option to go back (continue shopping button). Also, I give the user the option to remove individual items as well as “Clear” the whole shopping cart so that the user always feels like they are in control and can edit the shopping cart as needed. I decided to also include an image of the item in the shopping cart so that the user has some visual bearing to the product that they are purchasing.

High-Fidelity Prototype:

In my shopping cart high-fidelity prototype I continued to use a lot of white space and a grey color for text / buttons to continue the minimalist theme that I have for the rest of the website. I decided to have the background of the "Checkout" button be grey with white text and the "Continue Shopping" button background be white with grey text. This was so that the clear entry point for users could be to checkout, and to make it clear that this was the next action that should take place.
