

Barun Kwak

**What challenges or bugs did you encounter?**

One bug I encountered was when I was trying to display the information I was outputting in my console.log onto my shopping cart html page. I did not know why the information was not showing up and thought that there was an issue with my function to display my shopping cart. Another challenge I had was removing items from my shopping cart.

**How did you overcome those challenges?**

For my first bug in displaying the information, I overcame it by making a separate JavaScript file for my product detail page and for my shopping cart page. By separating the two files, all my \$(document).ready functions were being read and the shopping cart html page successfully displayed the products that I selected from the product detail page. In addition, I was able to successfully remove items from my shopping cart by using a \$(document).ready function we learned in labs by writing \$(this).parent().remove();.
